## **Listing of Claims:**

- 1-12. (Claims 1-12 are canceled)
- 13. (currently amended) In a computing device having programmable state transitions, a method for responding to a power management event, comprising: canceling a time event flag stored in a memory location;

determining said power management event;

storing a second time event flag into said memory location, wherein said second time event flag is set to one of a standby and a hibernate state, said storing occurring if said power management event is a request to transition to an active state and if a current time of day corresponds to a scheduled active time period; wherein

if said power management event is a request to transition to said standby state and if said current time of day does not correspond to a scheduled active period, then additionally performing:

rejecting said request to transition said computing device to said standby state;

setting said second time event flag to standby; and setting said time event flag to hibernate.

- 14. (original) The method of claim 13, wherein said second time event flag is a request to transition to said hibernate state.
- 15. (original) The method of claim 13, wherein said second time event flag is a request to transition to said standby state.
  - 16. (Claim 16 is canceled)
- 17. (original) The method of claim 13, wherein if said power management event is a request to transition to a hibernate state, then additionally performing: setting said time event flag to hibernate.

18. (currently amended) In a computing device having programmable state transitions, a method for responding to a time event flag, comprising:

determining if said time event flag is a request to set said computing device to a hibernate state;

setting a second time event flag to standby if said time event flag is set to hibernate; and

requesting said computing device to enter said hibernate state, wherein if said time event flag is not a request to set said computing device to a hibernate state, the method further comprising:

setting said second time event flag to hibernate; and requesting said computing device to enter a standby state.

19. (original) The method of claim 18, additionally comprising prompting a user of said computing device to confirm that said computing device should enter said hibernate state, said prompting being performed prior to said requesting action.

20-25. (Claims 20-25 are canceled)

26. (currently amended) One or more computer-readable media having computer-readable instructions thereon, which, when executed by a computer, cause the computer to generate a file used to transition from a hibernate to a standby state, the method comprising:

canceling a time event flag stored in a memory location;

determining said power management event;

storing a second time event flag into said memory location, wherein said second time event flag is set to one of a standby and a hibernate state, said storing occurring if said power management event is a request to transition to an active state and if a current time of day corresponds to a scheduled active time period, wherein

if said power management event is a request to transition to said standby state and if said current time of day does not correspond to a scheduled active period, then additionally performing:

rejecting said request to transition said computing device to said standby state;

setting said second time event flag to standby; and setting said time event flag to hibernate.

27. (currently amended) One or more computer-readable media having computer-readable instructions thereon, which, when executed by a computer, cause the computer to generate a file used to transition from a hibernate to a standby state, the method comprising:

determining if said time event flag is a request to set said computing device to a hibernate state;

setting a second time event flag to standby if said time event flag is set to hibernate; and

requesting the computing device to enter the hibernate state, wherein if said time event flag is not a request to set said computing device to a hibernate state, the method further comprising:

setting said second time event flag to hibernate; and requesting said computing device to enter a standby state.

28. (currently amended) The <u>computer-readable media of claim 27, wherein</u> the method of claim 27, additionally comprising further comprises prompting a user of said computing device to confirm that said computing device should enter said hibernate state, said prompting being performed prior to said requesting action.

- 29. (claim 29 is canceled)
- 30. (new) The computer-readable media of claim 26, wherein said second time event flag of the method is a request to transition to said hibernate state.
- 31. (new) The computer-readable media of claim 26, wherein said second time event flag of the method is a request to transition to said standby state.
- 32. (new) The computer-readable media of claim 26, wherein if said power management event is a request to transition to a hibernate state, then the method additionally performing:

setting said time event flag to hibernate.
